(54) Title: \(\alpha \times \text{MUTANTS}\)

#### (57) Abstract

The invention relates to a variant of a parent Termannyl-like o-amytise, comprising mutations in two, three, four, five or six regions/positions. The variants have increased themsolability at active plan and two Cape concentrations (relative to parent). The invention also relates to a DNA construct comprising a DNA sequence encoding an o-amytises variant of the invention, a recombine appearance of the contract of the invention, a recombined with a DNA construct of the invention, the use of an o-amytises variant of the invention, a magnitude of the invention of

Title: a-amylase mutants

#### FIELD OF THE INVENTION

The present invention relates, inter alia, to novel variants (mutants) of parent Termamyl-like  $\alpha$ -amylases, notably variants exhibiting increased thermostability at acidic pH and/or at low Ca² concentrations (relative to the parent) which are advantageous with respect to applications of the variants in, industrial starch processing particularly (e.g. starch liquefaction or saccharification).

#### BACKGROUND OF THE INVENTION

 $\alpha\textsc{-Amylases}$   $(\alpha\textsc{-1},4\textsc{-glucan-4-glucanohydrolases},$  EC 3.2.1.1) is constitute a group of enzymes which catalyze hydrolysis of starch and other linear and branched 1,4-glucosidic oligo- and polysaccharides.

There is a very extensive body of patent and scientific literature relating to this industrially very important class of 0 enzymes. A number of  $\alpha$ -amylase such as Termamyl-like  $\alpha$ -amylases variants are known from e.g. WO 90/11352, WO 95/10603, WO 95/26397, WO 96/23873 and WO 96/23874.

Among more recent disclosures relating to  $\alpha$ -amylases, NO 96/23874 provides three-dimensional, X-ray crystal structural data for a Termamyl-like  $\alpha$ -amylase which consists of the 300 N-terminal amino acid residues of the B. amyloliquefaciens  $\alpha$ -amylase and amino acids 301-483 of the C-terminal end of the B. licheniformis  $\alpha$ -amylase comprising the amino acid sequence (the latter being available commercially under the tradename Termamyl<sup>TM</sup>), and which is thus closely related to the industrially important Bacillus  $\alpha$ -amylases (which in the present context are embraced within the meaning of the term "Termamyllike  $\alpha$ -amylases", and which include, inter alia, the B. licheniformis, B. amyloliquefaciens and B. stearothermophilus  $\alpha$ -amylases). WO 96/23874 further describes methodology for

designing, on the basis of an analysis of the structure of a parent Termamyl-like  $\alpha$ -amylase, variants of the parent Termamyl-like  $\alpha$ -amylase which exhibit altered properties relative to the parent.

5 WO 95/35382 (Gist Brocades B.V.) concerns amylolytic enzymes derived from B. licheniformis with improved properties allowing reduction of the  $\text{Ca}^{2^+}$  concentration under application without a loss of performance of the enzyme. The amylolytic enzyme comprises one or more amino acid changes at positions selected 10 from the group of 104, 128, 187, 188 of the B. licheniformis  $\alpha$ -amylase sequence.

WO 96/23873 (Novo Nordisk) discloses Termamyl-like  $\alpha$ -amylase variants which have increased thermostability obtained by pairwise deletion in the region R181\*, G182\*, T183\* and G184\* of the sequence shown in SEQ ID NO: 1 herein.

#### BRIEF DISCLOSURE OF THE INVENTION

15

The present invention relates to novel  $\alpha$ -amylolytic variants (mutants) of a Termamyl-like  $\alpha$ -amylase, in particular variants exhibiting increased thermostability (relative to the parent) which are advantageous in connection with the industrial processing of starch (starch liquefaction, saccharification and the like).

The inventors have surprisingly found out that in case of combining two, three, four, five or six mutations (will be described below), the thermostability of Termamyl-like  $\alpha$ -amylases is increased at acidic pH and/or at low Ca²-concentration in comparison to single mutations, such as the mutation dislcosed in WO 96/23873 (Novo Nordisk), i.e. pairwise 30 deletion in the region R181\*, G182\*, T183\* and G184\* of the sequence shown in SEQ ID NO: 1 herein.

The invention further relates to DNA constructs encoding variants of the invention, to composition comprising variants of the invention, to methods for preparing variants of the invention, and to the use of variants and compositions of the invention, alone or in combination with other  $\alpha$ -amylolytic

WO 99/19467

3

PCT/DK98/06444

enzymes, in various industrial processes, e.g., starch liquefaction.

#### BRIEF DESCRIPTION OF THE DRAWING

- Figure 1 is an alignment of the amino acid sequences of six parent Termamyl-like  $\alpha$ -amylases in the context of the invention. The numbers on the Extreme left designate the respective amino acid sequences as follows:
  - 1: SEQ ID NO: 2,
- 10 2: Kaoamvl.
  - 3: SEO ID NO: 1.
  - 4: SEQ ID NO: 5,
  - 5: SEQ ID NO: 4,
  - 6: SEQ ID NO: 3.

15

#### DETAILED DISCLOSURE OF THE INVENTION

## The Termamyl-like q-amylase

It is well known that a number of a-amylases produced by Bacillus spp. are highly homologous on the amino acid level. For instance, the B. licheniformis a-amylase comprising the amino acid sequence shown in SEQ ID NO: 4 (commercially available as Termamyl™) has been found to be about 89% homologous with the B. amyloliquefaciens a-amylase comprising the amino acid sequence 25 shown in SEQ ID NO: 5 and about 79% homologous with the 8. stearothermophilus u-amylase comprising the amino acid sequence shown in SEQ ID NO: 3. Further homologous a-amylases include an α-amylase derived from a strain of the Bacillus sp. NCIB 12289, NCIB 12512, NCIB 12513 or DSM 9375, all of which are described in detail in WO 95/26397, and the  $\alpha$ -amylase described by Tsukamoto et al.. Biochemical and Biophysical Research Communications, 151 (1988), pp. 25-31.

Still further homologous  $\alpha$ -amylases include the  $\alpha$ -amylase produced by the *B. licheniformis* strain described in EP 0252666 (ATCC 27811), and the  $\alpha$ -amylases identified in WO 91/09353 and

WC 94/18314. Other commercial Termanyl-like B. licheniformis \$\alpha\$-amylases are Optitherm\(^{\mathbb{N}}\) and Takatherm\(^{\mathbb{N}}\) (available from Gist-brocades/Genencor), Spezym AA\(^{\mathbb{N}}\) and Spezyme Delta AA\(^{\mathbb{N}}\) (available from Genencor), and Keistase\(^{\mathbb{N}}\) (available from Daiwa).

Because of the substantial homology found between these  $\alpha$ -amylases, they are considered to belong to the same class of  $\alpha$ -amylases, namely the class of "Termamyl-like  $\alpha$ -amylases".

Accordingly, in the present context, the term "Termamyl-like  $\alpha$ -amylase" is intended to indicate an  $\alpha$ -amylase which, at the amino acid level, exhibits a substantial homology to Termamyl M. i.e. the B. licheniformis a-amylase having the amino acid sequence shown in SEQ ID NO: 4 herein. In other words, a Termamyl-like  $\alpha$ -amylase is an  $\alpha$ -amylase which has the amino acid sequence shown in SEQ ID NOS: 1, 2, 3, 4, 5, 6, 7 or 8 herein. and the amino acid sequence shown in SEQ ID NO: 1 of WO 95/26397 (the same as the amino acid sequence shown as SEQ ID NO: 7 herein) or in SEO ID NO: 2 of WO 95/26397 (the same as the amino acid sequence shown as SEQ ID NO: 8 herein) or in Tsukamoto et al., 1988, (which amino acid sequence is shown in SEO ID NO: 6 herein) or i) which displays at least 60%, preferred at least 70%, more preferred at least 75%, even more preferred at least 80%, especially at least 85%, especially preferred at least 90%, even especially more preferred at least 95% homology with at least one of said amino acid sequences shown in SEQ ID NOS 1 or 2 or 3 or 4 or 5 or 6 or 7 or 8 and/or ii) displays immunological cross-reactivity with an antibody raised against at least one of said a-amylases, and/or iii) is encoded by a DNA sequence which hybridizes to the DNA sequences encoding the above-specified &-amylases which are apparent from SEQ ID NOS: 9, 10, 11, or 12 of the present application (which encoding sequences encode the amino acid sequences shown in SEO ID NOS: 1, 2, 3, 4 and 5 herein, respectively), from SEQ ID NO: 4 of WO 95/26397 (which DNA sequence, together with the stop codon TAA.

is shown in SEQ ID NO: 13 herein and encodes the amino acid sequence shown in SEQ ID NO: 8 herein) and from SEQ ID NO: 5 of WO 95/26397 (shown in SEO ID NO: 14 herein), respectively.

In connection with property i), the "homology" may be determined by use of any conventional algorithm, preferably by use of the GAP progamme from the GCG package version 7.3 (June 1993) using default values for GAP penalties, which is a GAP creation penalty of 3.0 and GAP extension penalty of 0.1, (Genetic Computer Group (1991) Programme Manual for the GCG Package, version 7, 575 Science Drive, Madison, Wisconsin, USA 53711).

A structural alignment between Termamyl and a Termamyl-like  $\alpha$ -amylase may be used to identify equivalent/corresponding positions in other Termamyl-like  $\alpha$ -amylases. One method of obtaining said structural alignment is to use the Pile Up programme from the GCG package using default values of gap penalties, i.e., a gap creation penalty of 3.0 and gap extension penalty of 0.1. Other structural alignment methods include the hydrophobic cluster analysis (Gaboriaud et al., (1987), FEBS LETTERS 224, pp. 149-155) and reverse threading (Huber, T ; Torda, AE, PROTEIN SCIENCE Vol. 7, No. 1 pp. 142-149 (1998).

Property ii) of the  $\alpha$ -amylase, i.e. the immunological cross reactivity, may be assayed using an antibody raised against, or reactive with, at least one epitope of the relevant Termamyllike  $\alpha$ -amylase. The antibody, which may either be monoclonal or polyclonal, may be produced by methods known in the art, e.g. as described by Hudson et al., Practical Immunology, Third edition (1989), Blackwell Scientific Publications. The immunological cross-reactivity may be determined using assays known in the art, examples of which are Western Blotting or radial immunodiffusion assay, e.g. as described by Hudson et al., 1989. In this respect, immunological cross-reactivity between the  $\alpha$ -amylases having the amino acid sequences SEQ ID NOS: 1, 2, 3, 4, 5, 6, 7, or 8 respectively, have been found.

The oligonucleotide probe used in the characterization of the Termamyl-like  $\alpha$ -amylase in accordance with property iii) above

20

30

may suitably be prepared on the basis of the full or partial nucleotide or amino acid sequence of the  $\alpha$ -amylase in question.

Suitable conditions for testing hybridization involve presoaking in 5xSSC and prehybridizing for 1 hour at ~40°C in a solution of 20% formamide, 5xDenhardt's solution, 50mM sodium phosphate, pH 6.8, and 50mg of denatured sonicated calf thymus DNA, followed by hybridization in the same solution supplemented with 100mM ATP for 18 hours at ~40°C, followed by three times washing of the filter in 2xSSC, 0.2% SDS at 40°C for 30 minutes (low stringency), preferred at 50°C (medium stringency), more preferably at 65°C (high stringency), even more preferably at ~75°C (very high stringency). More details about the hybridization method can be found in Sambrook et al., Molecular Cloning: A Laboratory Manual, 2nd Ed., Cold Spring Harbor, 1989.

In the present context, "derived from" is intended not only to indicate an  $\alpha$ -amylase produced or producible by a strain of the organism in question, but also an  $\alpha$ -amylase encoded by a DNA sequence isolated from such strain and produced in a host organism transformed with said DNA sequence. Finally, the term is intended to indicate an  $\alpha$ -amylase which is encoded by a DNA sequence of synthetic and/or cDNA origin and which has the identifying characteristics of the  $\alpha$ -amylase in question. The term is also intended to indicate that the parent  $\alpha$ -amylase may be a variant of a naturally occurring  $\alpha$ -amylase, i.e. a variant which is the result of a modification (insertion, substitution, deletion) of one or more amino acid residues of the naturally occurring  $\alpha$ -amylase.

## Parent hybrid g-amylases

The parent  $\alpha$ -amylase may be a hybrid  $\alpha$ -amylase, i.e. an  $\alpha$ -amylase which comprises a combination of partial amine acid sequences derived from at least two  $\alpha$ -amylases.

The parent hybrid  $\alpha$ -amylase may be one which on the basis of amino acid homology and/or immunological cross-reactivity and/or

DNA hybridization (as defined above) can be determined to belong to the Termamyl-like  $\alpha$ -amylase family. In this case, the hybrid  $\alpha$ -amylase is typically composed of at least one part of a Termamyl-like  $\alpha$ -amylase and part(s) of one or more other  $\alpha$ - amylases selected from Termamyl-like  $\alpha$ -amylases or non-Termamyl-like  $\alpha$ -amylases of microbial (bacterial or fungal) and/or mammalian origin.

Thus, the parent hybrid  $\alpha$ -amylase may comprise a combination of partial amino acid sequences deriving from at least two Termamyl-like  $\alpha$ -amylases, or from at least one Termamyl-like and at least one non-Termamyl-like bacterial  $\alpha$ -amylase, or from at least one Termamyl-like and at least one fungal  $\alpha$ -amylase. The Termamyl-like  $\alpha$ -amylase from which a partial amino acid sequence derives may, e.g., be any of those specific Termamyl-like  $\alpha$ -

s amylases referred to herein.

For instance, the parent  $\alpha$ -amylase may comprise a C-terminal part of an \alpha-amylase derived from a strain of B. licheniformis, and a N-terminal part of an \u03c4-amylase derived from a strain of B. amyloliquefaciens or from a strain of B. stearothermophilus. For instance, the parent α-amylase may comprise at least 430 amino acid residues of the C-terminal part of the B. licheniformis u-amylase, and may, e.g. comprise a) an amino acid segment corresponding to the 37 N-terminal amino acid residues of the B. amyloliquefaciens \(\alpha\)-amylase having the amino acid sequence shown in SEQ ID NO: 5 and an amino acid segment corresponding to the 445 C-terminal amino acid residues of the B. licheniformis α-amylase having the amino acid sequence shown in SEQ ID No. 4, or b) an amino acid segment corresponding to the 68 N-terminal amino acid residues of the B. stearothermophilus α-amylase having the amino acid sequence shown in SEQ ID NO: 3 and an amino acid segment corresponding to the 415 Cterminal amino acid residues of the B. licheniformis q-amylase having the amino acid sequence shown in SEO ID NO: 4.

The non-Termamyl-like  $\alpha$ -amylase may, e.g., be a fungal  $\alpha$ -amylase, a mammalian or a plant  $\alpha$ -amylase or a bacterial  $\alpha$ -amylase (different from a Termamyl-like  $\alpha$ -amylase). Specific examples of such  $\alpha$ -amylases include the Aspergillus oxyzee TAKA  $\alpha$ -amylase, the A. niger acid  $\alpha$ -amylase, the Bacillus subtilis  $\alpha$ -amylase, the porcine pancreatic  $\alpha$ -amylase and a barley  $\alpha$ -amylase. All of these  $\alpha$ -amylases have elucidated structures which are markedly different from the structure of a typical Termamyl-like  $\alpha$ -amylase as referred to herein.

The fungal  $\alpha$ -amylases mentioned above, i.e. derived from A. niger and A. oryzae, are highly homologous on the amino acid level and generally considered to belong to the same family of  $\alpha$ -amylases. The fungal  $\alpha$ -amylase derived from Aspergillus oryzae is commercially available under the tradename Fungamyl $^{\text{TM}}$ .

Furthermore, when a particular variant of a Termamyl-like  $\alpha$ -amylase (variant of the invention) is referred to - in a conventional manner - by reference to modification (e.g. deletion or substitution) of specific amino acid residues in the amino acid sequence of a specific Termamyl-like  $\alpha$ -amylase, it is to be understood that variants of another Termamyl-like  $\alpha$ -amylase modified in the equivalent position(s) (as determined from the best possible amino acid sequence alignment between the respective amino acid sequences) are encompassed thereby.

A preferred embodiment of a variant of the invention is one 25 derived from a B. licheniformis  $\alpha$ -amylase (as parent Termamyllike  $\alpha$ -amylase), e.g. one of those referred to above, such as the B. licheniformis  $\alpha$ -amylase having the amino acid sequence shown in SEO ID NO: 4.

## 30 Construction of variants of the invention

The construction of the variant of interest may be accomplished by cultivating a microorganism comprising a DNA sequence encoding the variant under conditions which are conducive for producing the variant. The variant may then

WO 99/19467 PCT/DK98/80444

9

subsequently be recovered from the resulting culture broth. This is described in detail further below.

## Altered properties of variants of the invention

The following discusses the relationship between mutations which may be present in variants of the invention, and desirable alterations in properties (relative to those a parent, Termamyllike  $\alpha$ -amylase) which may result therefrom.

# 10 Increased thermostability at acidic pR and/or at low Ca<sup>2</sup> concentration

Mutations of particular relevance in relation to obtaining variants according to the invention having increased thermostability at acidic pH and/or at low  $Ca^{S'}$  concentration include mutations at the following positions (relative to B. licheniformis  $\alpha$ -amylase, SEQ TD NO: 4):

H156, N172, A181, N188, N190, H205, D207, A209, A210, E211, O264, N265.

In the context of the invention the term "acidic pH" means a 20 pH below 7.0, especially below the pH range, in which industrial starch liquefaction processes are normally performed, which is between pH 5.5 and 6.2.

In the context of the present invention the term "low Calcium concentration" means concentrations below the normal level used in industrial starch liquefaction. Normal concentrations vary depending of the concentration of free  ${\rm Ca}^{2^*}$  in the corn. Normally a dosage corresponding to  ${\rm ImM}$  (40ppm) is added which together with the level in corn gives between 40 and 60ppm free  ${\rm Ca}^{2^*}$ .

In the context of the invention the term "high temperatures"

means temperatures between 95°C and 160°C, especially the temperature range in which industrial starch liquefaction processes are normally performed, which is between 95°C and 105°C.

The inventors have now found that the thermostability at acidic pH and/or at low Ca<sup>5\*</sup> concentration may be increased even more by combining certain mutations including the above

mentioned mutations and/or I201 with each other.

Said "certain" mutations are the following (relative to B. licheniformis  $\alpha$ -amylase, SEQ ID NO: 4): N190, D207, E211, Q264 and I201.

Said mutation may further be combined with deletions in one, preferably two or even three positions as described in WO 96/23873 (i.e. in positions R181, G182, T183, G184 in SEQ ID NO: 1 herein). According to the invention variants of a parent Termamyl-like  $\alpha$ -amylase with  $\alpha$ -amylase activity comprising mutations in two, three, four, five or six of the above positions are contemplated.

It should be emphazised that not only the Termamyl-like  $\alpha$ amylases mentioned specifically below are contemplated. Also
other commercial Termamyl-like  $\alpha$ -amylases are contemplated. An
unexhaustive list of such  $\alpha$ -amylases is the following:

 $\alpha$ -amylases produced by the *B. licheniformis* strain described in EF 0252666 (ATCC 27811), and the  $\alpha$ -amylases identified in WO 91/00353 and WO 94/18314. Other commercial Termanyl-like *B. licheniformis*  $\alpha$ -amylases are Optitherm<sup>TM</sup> and Takatherm<sup>TM</sup> (available from Solvay), Maxamyl<sup>TM</sup> (available from Gistbrocades/Genencor), Spezym AA<sup>TM</sup> Spezyme Delta AA<sup>TM</sup> (available from Genencor), and Keistase<sup>TM</sup> (available from Daiwa).

It may be mentioned here that amino acid residues, respectively, at positions corresponding to N190, I201, D207 and 25 E211, respectively, in SEQ ID NO: 4 constitute amino acid residues which are conserved in numerous Termamyl-like α-amylases. Thus, for example, the corresponding positions of these residues in the amino acid sequences of a number of Termamyl-like α-amylases which have already been mentioned (vide 30 supra) are as follows:

Table 1.

Termamyl-like  $\alpha$ -amylase N I D E Q 35

B. licheniformis (SEQ ID NO: 4)	N190	1201	0207	E211	Q264
B. amyloliquefaciens (SEQ ID NO: 5)	N190	V201	D207	2211	Q264
B. stearothermophilus (SEQ ID NO: 3)	N193	1,204	E210	E214	
Bacillus WO 95/26397 (SEQ ID NO; 2)	N195	V206	E212	E216	
Bacillus WO 95/26397 (SEQ ID NO: 1)	N195	V206	8213	2216	* * *
"Bacillus sp. #767" (SEQ ID NO: 6)	N195	1206	E212	B216	~ ~ ~

Mutations of these conserved amino acid residues are very important in relation to improving thermostability at acidic pN and/or at low calcium concentration, and the following mutations are of particular interest in this connection (with reference to the numbering of the B. licheniformis amino acid sequence shown in SEQ ID NO: 4).

Pair-wise amino acid deletions at positions corresponding to R179-G182 in SEQ ID NO: 5 corresponding to a gap in Seq ID NO: 4. when aligned with a numerous Termamyl-like α-amylases. Thus, for example, the corresponding positions of these residues in the amino acid sequences of a number of Termamyl-like α-amylases which have already been mentioned (vide supra) are as follows:

Table 2.

25	Termamyl-like α-amylase Pair	wise amino acid deletions among
20	B. amyloliquefaciens (BEQ ID No.5)	R175, G177, E178, G179
	B. stearothermophilus (SEQ ID No.3)	R179, G180, I181, G182
	Bacillus WO 95/26397 (SEQ ID No.2)	R181, G192, T183, G184
	Bacillus WO 95/26397 (SEQ ID No.1)	R191, G182, D183, G184
30	"Bacillus ap. #707" (SEQ ID No.6)	R181, G182, H183, G184

When using SEQ ID NO: 1 to SEQ ID NO: 6 as the backbone (i.e. as the parent Termamyl-like  $\alpha$ -amylase) two, three, four, five or six mutations may according to the invention be made in the following regions/positions to increase the thermostability at acidic pH and/or at low  $Ca^{2+}$  concentrations (relative to the parent):

(relative to Seq ID NO: 1 herein):

Comtemplated according to the present invention is combining three, four, five or six mutation,

Specific double mutations for backbone SEQ ID NO: 1 to SEQ ID NO: 6 are listed in the following.

Using SEC ID NO: 1 as the backbone the following double 10 mutantions resulting in the desired effect are comtemplated according to the invention:

-R181\*/G182\*/N195A,R,D,C,E,Q,G,H,I,L,K,M,F,P,S,T,W,Y,V;

-G182\*/T183\*/N195A, R, D, C, E, Q, G, H, I, L, K, M, F, P, S, T, W, Y, V;

All Termamyl-like a-amylase defined above may suitably be used as backbone for preparing variants of the invention.

However, in a preferred embodiment the variant comprises the following mutations: N190F/Q264S in SEQ ID NO: 4 or corresponding positiones in another parent Termamyl-like aamylases.

In another embodiment the variant of the invention comprises

PCT/DK98/00444 WO 99/19467 19

the following mutations: I181\*/G182\*/N193F in SEQ ID NO: 3 (TVB146) or in corresponding positions in another parent Termamyi-like q-amylases. Said variant may further comprise a substitution in position E214Q.

In a preferred embodiment of the invention the parent 5 Termamyl-like  $\alpha$ -amylase is a hybrid  $\alpha$ -amylase of SEO ID NO: 4 and SEO ID NO: 5. Specifically, the parent hybrid Termamyl-like α-amylase may be a hybrid alpha-amylase comprising the 445 Cterminal amino acid residues of the B. licheniformis a-amylase 10 shown in SEO ID NO: 4 and the 37 N-terminal amino acid residues of the a-amylase derived from B. amyloliquefaciens shown in SEQ ID NO: 5, which may suitably further have the following mutations: H156Y+A181T+N190F+A209V+Q264S (using the numbering in SEQ ID NO: 4). The latter mentioned hybrid is used in the examples below and is referred to as LE174. 15

### General mutations in variants of the invention

30

It may be preferred that a variant of the invention comprises one or more modifications in addition to those outlined above. Thus, it may be advantageous that one or more proline residues present in the part of the  $\alpha$ -amylase variant which is modified is/are replaced with a non-proline residue which may be any of the possible, naturally occurring non-proline residues, and which preferably is an alanine, glycine, serine, threonine, valine or lencine.

Analogously, it may be preferred that one or more cysteine residues present among the amino acid residues with which the parent α-amylase is modified is/are replaced with a non-cysteine residue such as serine, alanine, threonine, qlycine, valine or Leocine.

Furthermore, a variant of the invention may - either as the only modification or in combination with any of the above outlined modifications - be modified so that one or more Asp and/or Glu present in an amino acid fragment corresponding to the amino acid fragment 185-209 of SEQ ID NO: 4 is replaced by an Asn and/or Gln, respectively. Also of interest is the WO 99/19467 PCT/DK98/00444 20

replacement, in the Termamyl-like  $\alpha$ -amylase, of one or more of the Lys residues present in an amino acid fragment corresponding to the amino acid fragment 185-209 of SEQ ID NO: 4 by an Arg.

It will be understood that the present invention encompasses 5 variants incorporating two or more of the above outlined modifications.

Furthermore, it may be advantageous to introduce pointmutations in any of the variants described herein.

## 10 Methods for preparing g-amylase variants

15

Several methods for introducing mutations into genes are known in the art. After a brief discussion of the cloning of aamylase-encoding DNA sequences, methods for generating mutations at specific sites within the  $\alpha$ -amylase-encoding sequence will be discussed.

#### Cloning a DNA sequence encoding an a-amylase

The DNA sequence encoding a parent a-amylase may be isolated from any cell or microorganism producing the  $\alpha$ -amylase in question, using various methods well known in the art. First, a genomic DNA and/or cDNA library should be constructed using chromosomal DNA or messenger RNA from the organism that produces the  $\alpha$ -amylase to be studied. Then, if the amino acid sequence of the a-amylase is known, homologous, labelled oligonucleotide probes may be synthesized and used to identify α-amylaseencoding clones from a genomic library prepared from the organism in question. Alternatively, a labelled oligonucleotide probe containing sequences homologous to a known a-amylase gene could be used as a probe to identify a-amylase-encoding clones, 30 using hybridization and washing conditions of lower stringency.

Yet another method for identifying a-amylase-encoding clones would involve inserting fragments of genomic DNA into an expression vector, such as a plasmid, transforming a-amylasenegative bacteria with the resulting genomic DNA library, and then plating the transformed bacteria onto agar containing a substrate for  $\alpha$ -amylase, thereby allowing clones expressing the  $\alpha$ -amylase to be identified.

Alternatively, the DNA sequence encoding the enzyme may be 5 prepared synthetically by established standard methods, e.g. the phosphoroamidite method described by S.L. Beaucage and M.H. Caruthers (1981) or the method described by Matthes et al. (1984). In the phosphoroamidite method, oligonucleotides are synthesized, e.g. in an automatic DNA synthesizer, purified, annealed, ligated and cloned in appropriate vectors.

Finally, the DNA sequence may be of mixed genomic and synthetic origin, mixed synthetic and cDNA origin or mixed genomic and cDNA origin, prepared by ligating fragments of synthetic, genomic or cDNA origin (as appropriate, the fragments corresponding to various parts of the entire DNA sequence), in accordance with standard techniques. The DNA sequence may also be prepared by polymerase chain reaction (PCR) using specific primers, for instance as described in US 4,683,202 or R.K. Saiki et al. (1988).

20

#### Site-directed mutagenesis

Once an α-amylase-encoding DNA sequence has been isolated, and desirable sites for mutation identified, mutations may be introduced using synthetic oligonuclectides. These oligonuclectides contain nucleotide sequences flanking the desired mutation sites; mutant nucleotides are inserted during oligonucleotide synthesis. In a specific method, a single-stranded gap of DNA, bridging the α-amylase-encoding sequence, is created in a vector of carrying the α-amylase gene. Then the synthetic nucleotide, bearing the desired mutation, is annealed to a homologous portion of the single-stranded DNA. The remaining gap is then filled in with DNA polymerase I (Klenow fragment) and the construct is ligated using T4 ligase. A specific example of this method is described in Morinaga et al. (1984). US 4,760,025 discloses the introduction of oligonucleotides encoding multiple

WO 99/19467 PCT/DK98/08444

22

mutations by performing minor alterations of the cassette. However, an even greater variety of mutations can be introduced at any one time by the Morinaga method, because a multitude of oligonucleotides, of various lengths, can be introduced.

S Another method for introducing mutations into α-amylaseencoding DNA sequences is described in Nelson and Long (1989).

It involves the 3-step generation of a PCR fragment containing
the desired mutation introduced by using a chemically synthesized DNA strand as one of the primers in the PCR reactions

10 From the PCR-generated fragment, a DNA fragment carrying the
mutation may be isolated by cleavage with restriction

endonucleases and reinserted into an expression plasmid.

#### Random Mutagenesis

15

Random mutagenesis is suitably performed either as localised or region-specific random mutagenesis in at least three parts of the gene translating to the amino acid sequence shown in question, or within the whole gene.

20 The random mutagenesis of a DNA sequence encoding a parent  $\alpha$ amylase may be conveniently performed by use of any method known in the art.

In relation to the above, a further aspect of the present invention relates to a method for generating a variant of a 25 parent α-amylase, e.g. wherein the variant exhibits altered or increased thermal stability relative to the parent, the method comprising:

- (a) subjecting a DNA sequence encoding the parent  $\alpha$ -amylase to random mutagenesis.
- 30 (b) expressing the mutated DNA sequence obtained in step (a) in a host cell, and
  - (c) screening for host cells expressing an  $\alpha$ -amylase variant which has an altered property (i.e. thermal stability) relative to the parent  $\alpha$ -amylase.

Step (a) of the above method of the invention is preferably performed using doped primers.

For instance, the random mutagenesis may be performed by use of a suitable physical or chemical mutagenizing agent, by use of a suitable oligonucleotide, or by subjecting the DNA sequence to FCR generated mutagenesis. Furthermore, the random mutagenesis may be performed by use of any combination of these mutagenizing agents. The mutagenizing agent may, e.g., be one which induces transitions, transversions, inversions, scrambling, deletions, and/or insertions.

Examples of a physical or chemical mutagenizing agent suitable for the present purpose include ultraviolet (UV) ir-radiation, hydroxylamine, N-methyl-N'-nitro-N-mitrosoguanidine (MNNG), O-methyl hydroxylamine, nitrous acid, ethyl methane sulphonate (EMS), sodium bisulphite, formic acid, and nucleotide analogues. When such agents are used, the mutagenesis is typically performed by incubating the DNA sequence encoding the parent enzyme to be mutagenized in the presence of the mutagenizing agent of choice under suitable conditions for the mutagenesis to take place, and selecting for mutated DNA having the desired properties.

When the mutagenesis is performed by the use of an oligonucleotide, the oligonucleotide may be doped or spiked with the three non-parent nucleotides during the synthesis of the cligonucleotide at the positions which are to be changed. The doping or spiking may be done so that codons for unwanted amino acids are avoided. The doped or spiked oligonucleotide can be incorporated into the DNA encoding the α-amylase enzyme by any published technique, using e.g. PCR, LCR or any DNA polymerase and ligase as deemed appropriate.

introduction of stop codons is avoided.

WO 99/19467 PCT/DK98/00444 24

Preferably, the doping is carried out using "constant random doping", in which the percentage of wild-type and mutation in each position is predefined. Furthermore, the doping may be directed toward a preference for the introduction of certain nucleotides, and thereby a preference for the introduction of one or more specific amino acid residues. The doping may be made, e.g., so as to allow for the introduction of 90% wild type and 10% mutations in each position. An additional consideration in the choice of a doping scheme is based on genetic as well as protein-structural constraints. The doping scheme may be made

When PCR-generated mutagenesis is used, either a chemically treated or non-treated gene encoding a parent  $\alpha$ -amylase is subjected to PCE under conditions that increase the misincorporation of nucleotides (Deshler 1992; Leung et al., Technique, Vol.1, 1989, pp. 11-15).

by using the DOPE program which, inter alia, ensures that

A mutator strain of E. coli (Fowler et al., Molec. Gen. Genet., 133, 1974, pp. 179-191), S. cereviseae or any other microbial organism may be used for the random mutagenesis of the DNA encoding the  $\alpha$ -amylase by, e.g., transforming a plasmid containing the parent glycosylase into the mutator strain, growing the mutator strain with the plasmid and isolating the mutated plasmid from the mutator strain. The mutated plasmid may be subsequently transformed into the expression organism.

The DNA sequence to be mutagenized may be conveniently present in a genomic or cDNA library prepared from an organism expressing the parent  $\alpha$ -amylase. Alternatively, the DNA sequence may be present on a suitable vector such as a plasmid or a 30 bacteriophage, which as such may be incubated with or other-wise exposed to the mutagenising agent. The DNA to be mutagenized may also be present in a host cell either by being integrated in the genome of said cell or by being present on a vector harboured in the cell. Finally, the DNA to be mutagenized may be in isolated 35 form. It will be understood that the DNA sequence to be subjected to random mutagenesis is preferably a cDNA or a genomic DNA sequence.

In some cases it may be convenient to amplify the mutated DNA sequence prior to performing the expression step b) or the screening step c). Such amplification may be performed in accordance with methods known in the art, the presently preferred method being PCR-generated amplification using oligonucleotide primers prepared on the basis of the DNA or amino acid sequence of the parent enzyme.

Subsequent to the incubation with or exposure to the mutagenising agent, the mutated DNA is expressed by culturing a suitable host cell carrying the DNA sequence under conditions allowing expression to take place. The host cell used for this purpose may be one which has been transformed with the mutated DNA sequence, optionally present on a vector, or one which was carried the DNA sequence encoding the parent enzyme during the mutagenesis treatment. Examples of suitable host cells are the following: gram positive bacteria such as Bacillus subtilis, Bacillus licheniformis, Bacillus lentus, Bacillus brevis. Bacillus stearothermophilus, Bacillus alkalophilus, Bacillus amyloliquefaciens, Bacillus coagulans, Bacillus circulans, Bacillus lautus, Bacillus megaterium, Bacillus thuringiensis, Streptomyces lividans or Streptomyces murinus; and gram-negative bacteria such as E. coli.

The mutated DNA sequence may further comprise a DNA sequence encoding functions permitting expression of the mutated DNA sequence.

#### Localized random mutagenesis

The random mutagenesis may be advantageously localized to a part of the parent α-amylase in question. This may, e.g., be advantageous when certain regions of the enzyme have been identified to be of particular importance for a given property of the enzyme, and when modified are expected to result in a variant having improved properties. Such regions may normally be identified when the tertiary structure of the parent enzyme has been elucidated and related to the function of the enzyme.

The localized, or region-specific, random mutagenesis is conveniently performed by use of PCR generated mutagenesis techniques as described above or any other suitable technique known in the art. Alternatively, the DNA sequence encoding the part of the DNA sequence to be modified may be isolated, e.g., by insertion into a suitable vector, and said part may be subsequently subjected to mutagenesis by use of any of the mutagenesis methods discussed above.

## 10 Alternative methods of providing g-amylase variants

Alternative methods for providing variants of the invention include gene shuffling method known in the art including the methods e.g. described in WO 95/22625 (from Affymax Technologies N.V.) and WO 96/00343 (from Novo Nordisk A/S).

#### Expression of g-amylase variants

15

25

According to the invention, a DNA sequence encoding the variant produced by methods described above, or by any alternative methods known in the art, can be expressed, in enzyme form, using an expression vector which typically includes control sequences encoding a promoter, operator, ribosome binding site, translation initiation signal, and, optionally, a repressor gene or various activator genes.

The recombinant expression vector carrying the DNA sequence encoding an  $\alpha$ -amylase variant of the invention may be any vector which may conveniently be subjected to recombinant DNA procedures, and the choice of vector will often depend on the host cell into which it is to be introduced. Thus, the vector may be an autonomously replicating vector, i.e. a vector which exists as an extrachromosomal entity, the replication of which is independent of chromosomal entity, the replication of which is independent of chromosomal element, minichromosome or an artificial chromosome. Alternatively, the vector may be one which, when introduced into a host cell, is integrated into the host cell genome and replicated together with the chromosome(s) into which it has been integrated.

In the vector, the DNA sequence should be operably connected

30

WO 99/19467 PCT/DK98/00444 27

to a suitable promoter sequence. The promoter may be any DNA sequence which shows transcriptional activity in the host cell of choice and may be derived from genes encoding proteins either homologous or heterologous to the host cell. Examples of suitable promoters for directing the transcription of the DNA sequence encoding an  $\alpha$ -amylase variant of the invention, especially in a bacterial host, are the promoter of the lac operon of E.coli, the Streptomyces coelicolor agarase gene degA promoters, the promoters of the Bacillus licheniformis  $\alpha$ -amylase gene (smyL), the promoters of the Bacillus stearothermophilus maltogenic amylase gene (amyM), the promoters of the Bacillus amyloliquefaciens a-amylase (amyQ), the promoters of the Bacillus subtilis xylA and xylB genes etc. For transcription in a fungal host, examples of useful promoters are those derived from the gene encoding A. oryzae TAKA amylase, Rhizomucor miehei aspartic proteinase, A. niger neutral  $\alpha$ -amylase, A. niger acid stable d-amylase, A. niger glucoamylase, Rhizomucor miehei lipase, A. cryzae alkaline protease, A. cryzae triose phosphate isomerase or A. nidulans acetamidase.

The expression vector of the invention may also comprise a suitable transcription terminator and, in eukaryotes, polyadenylation sequences operably connected to the DNA sequence encoding the  $\alpha$ -amylase variant of the invention. Termination and polyadenylation sequences may suitably be derived from the same sources as the promoter.

The vector may further comprise a DNA sequence enabling the vector to replicate in the host cell in question. Examples of such sequences are the origins of replication of plasmids pUC19, pACYC177, pUB110, pE194, pAMB1 and pIJ702.

The vector may also comprise a selectable marker, e.g. a gene the product of which complements a defect in the host cell, such as the dal genes from B. subtilis or B. licheniformis, or one which confers antibiotic resistance such as kanamycin, chloramphenicol or tetracyclin resistance. Furthermore, the vector may comprise Aspergillus selection markers such as amdS, argB, niaD and sC, a marker giving rise to hygromycin resistance, or the selection may be accomplished by co-transformation, e.g. as described in WO 91/17243.

While intracellular expression may be advantageous in some respects, e.g. when using certain bacteria as host cells, it is 5 generally preferred that the expression is extracellular. In general, the Bacillus  $\alpha$ -amylases mentioned herein comprise a preregion permitting secretion of the expressed protease into the culture medium. If desirable, this preregion may be replaced by a different preregion or signal sequence, conveniently accomplished by substitution of the DNA sequences encoding the respective preregions.

The procedures used to ligate the DNA construct of the invention encoding an  $\alpha$ -amylase variant, the promoter, terminator and other elements, respectively, and to insert them into suitable vectors containing the information necessary for replication, are well known to persons skilled in the art (cf., for instance, Sambrook et al., Molecular Cloning: A Laboratory Manual, 2nd Ed., Cold Spring Harbor, 1989).

The cell of the invention, either comprising a DNA construct or an expression vector of the invention as defined above, is advantageously used as a host cell in the recombinant production of an α-amylase variant of the invention. The cell may be transformed with the DNA construct of the invention encoding the variant, conveniently by integrating the DNA construct (in one or more copies) in the host chromosome. This integration is generally considered to be an advantage as the DNA sequence is more likely to be stably maintained in the cell. Integration of the DNA constructs into the host chromosome may be performed according to conventional methods, e.g. by homologous or heterologous recombination. Alternatively, the cell may be transformed with an expression vector as described above in connection with the different types of host cells.

The cell of the invention may be a cell of a higher organism such as a mammal or an insect, but is preferably a microbial cell, e.g. a bacterial or a fungal (including yeast) cell.

Examples of suitable bacteria are grampositive bacteria such as Bacillus subtilis, Bacillus licheniformis, Bacillus lentus,

Bacillus brevis, Bacillus stearothermophilus, Bacillus alkalophilus, Bacillus amyloliquefaciens, Bacillus coagulans, Bacillus circulans, Bacillus lautus, Bacillus megaterium, Bacillus thuringiensis, or Streptomyces lividans or Streptomyces murinus, or gramnegative bacteria such as E.coli. The transformation of the bacteria may, for instance, be effected by protoplast transformation or by using competent cells in a manner known per se.

The yeast organism may favourably be selected from a species of Saccharomyces or Schizosaccharomyces, e.g. Saccharomyces of cerevisiae. The filamentous fungus may advantageously belong to a species of Aspergillus, e.g. Aspergillus oryzae or Aspergillus niger. Fungal cells may be transformed by a process involving protoplast formation and transformation of the protoplasts followed by regeneration of the cell wall in a manner known per se. A suitable procedure for transformation of Aspergillus host cells is described in EP 238 023.

In yet a further aspect, the present invention relates to a method of producing an  $\alpha$ -amylase variant of the invention, which method comprises cultivating a host cell as described above under conditions conducive to the production of the variant and recovering the variant from the cells and/or culture medium.

The medium used to cultivate the cells may be any conventional medium suitable for growing the host cell in question and obtaining expression of the  $\alpha$ -amylase variant of the invention. Suitable media are available from commercial suppliers or may be prepared according to published recipes (e.g. as described in catalogues of the American Type Culture Collection).

The  $\alpha$ -amylase variant secreted from the host cells may conveniently be recovered from the culture medium by well-known procedures, including separating the cells from the medium by centrifugation or filtration, and precipitating proteinaceous components of the medium by means of a salt such as ammonium sulphate, followed by the use of chromatographic procedures such as ion exchange chromatography, affinity chromatography, or the like.

35

The \$\alpha\$-amylase variants of this invention possesses valuable properties allowing for a variety of industrial applications. In particular, enzyme variants of the invention are applicable as a component in washing, dishwashing and hard-surface cleaning detergent compositions. Numerous variants are particularly useful in the production of sweeteners and ethanol from starch, and/or for textile desizing. Conditions for conventional starch-conversion processes, including starch liquefaction and/or saccharification processes, are described in, e.g., US 3,912,590 and in EF patent publications Nos. 252 730 and in EF patent

## Production of sweeteners from starch:

A "traditional" process for conversion of starch to fructose syrups normally consists of three consecutive enzymatic processes, viz. a liquefaction process followed by a saccharification process and an isomerization process. During the liquefaction process, starch is degraded to dextrins by an  $\alpha$ -amylase (e.g. Termamylm) at pH values between 5.5 and 6.2 and at temperatures of 95-160°C for a period of approx. 2 hours. In order to ensure an optimal enzyme stability under these conditions, 1 mM of calcium is added (40 ppm free calcium ions).

After the liquefaction process the dextrins are converted into dextrose by addition of a glucoamylase (e.g. AMG\*\*\*) and a debranching enzyme, such as an isoamylase or a pullulanase (e.g. Promozyme\*\*\*). Before this step the pH is reduced to a value below 4.5, maintaining the high temperature (above 95°C), and the liquefying  $\alpha$ -amylase activity is denatured. The temperature is lowered to 60°C, and glucoamylase and debranching enzyme are added. The saccharification process proceeds for 24-72 hours.

After the saccharification process the pH is increased to a value in the range of 6-8, preferably pH 7.5, and the calcium is removed by ion exchange. The dextrose syrup is then converted into high fructose syrup using, e.g., an immmobilized glucoseisomerase (such as Sweetzyme<sup>m</sup>).

35 At least 1 enzymatic improvements of this process could be envisaged. Reduction of the calcium dependency of the liquefying  $\alpha$ -amylase. Addition of free calcium is required to

WO 99/19467 PCT/DK 98/00444 31

ensure adequately high stability of the  $\alpha$ -amylase, but free calcium strongly inhibits the activity of the glucoseisomerase and needs to be removed, by means of an expensive unit operation, to an extent which reduces the level of free calcium to below 3-5 ppm. Cost savings could be obtained if such an operation could be avoided and the liquefaction process could be performed without addition of free calcium ions.

To achieve that, a less calcium-dependent Termamyl-like stable a-amylase which is and highly active at concentrations of free calcium (< 40 ppm) is required. Such a Termamyl-like  $\alpha$ -amylase should have a pH optimum at a pH in the range of 4.5-6.5, preferably in the range of 4.5-5.5.

## Detergent compositions

25

As mentioned above, variants of the invention may suitably be 15 incorporated detergent ín compositions, Increased thermostability at low calcium concentrations would be very beneficial for amylase performance in detergents, i.e. the alkaline region. Reference is made, for example, to WO 96/23874 and WO 97/07202 for further details concerning ingredients of detergent compositions (such as laundry or dishwashing detergents), appropriate methods of formulating the variants in such detergent compositions, and for examples of relevant types of detergent compositions.

Detergent compositions comprising a variant of the invention may additionally comprise one or more other enzymes, such as a lipase, cutinase, protease, cellulase, peroxidase or laccase, and/or another α-amylase.

α-amylase variants of the invention may be incorporated in detergents at conventionally employed concentrations. It is at present contemplated that a variant of the invention may be incorporated in an amount corresponding to 0.00001-1 (calculated as pure, active enzyme protein) of  $\alpha$ -amylase per liter of wash/dishwash liquor using conventional dosing levels 35 of determent.

The invention also relates to a composition comprising

a mixture of one or more variants of the invention derived from parent Termamyl-like α-amylase) the stearothermophilus  $\alpha$ -amylase having the sequence shown in SEO ID NO: 3 and a Termamyl-like alpha-amylase derived from the B. licheniformis a-amylase having the sequence shown in SEQ ID NO: 4.

Further. the invention also relates to a comprising a mixture of one or more variants according the invention derived from (as the parent Termamyl-like  $\alpha$ -amylase) the B. stearothermophilus a-amylase having the sequence shown in SEQ ID NO: 3 and a hybrid alpha-amylase comprising a part of the B. amyloliquefaciens \u03c4-amylase shown in SEQ ID NO: 5 and a part of the B. licheniformis a-amylase shown in SEQ ID NO: 4. The latter mentioned hydrid Termamyl-like \alpha-amylase comprises the 445 C-terminal amino acid residues of the Β. licheniformis αamylase shown in SEQ ID NO: 4 and the 37 N-terminal amino acid residues of the α-amylase derived from B. amyloliquefaciens shown in SEQ ID NO: 5. Said latter mentioned hybrid  $\alpha$ -amylase suitably comprise the following H156Y+A181T+N190F+A209V+Q264S (using the numbering in SEQ ID NO: 4). In the examples below said hybrid parent Termamyl-like  $\alpha$ amylase, is used in combination with variants of the invention, which variants may be used in compositions of the invention.

In a specific embodiment of the invention the composition 25 comprises a mixture of TVB146 and LE174, e.g., in a ratio of 2:1 to 1:2, such as 1:1.

A  $\alpha$ -amylase variant of the invention or a composition of the invention may in an aspect of the invention be used for washing and/or dishwashing; for textile desizing or for starch liquefaction.

#### MATERIALS AND METHODS

#### Enzymes:

BSG alpha-amylase: B. stearothermophilus alpha-amylase depicted in SEO ID NO: 3.

- TVB146 alpha-amylase variant: *B. stearothermophilus* alpha-amylase variant depicted in SEQ ID NO: 3 with the following mutations: with the deletion in positions I181-G182 + N193F. LE174 hybrid alpha-amylase variant:
- LE174 is a hybrid Termamyl-like alpha-amylase being identical to the Termamyl sequence, i.e., the Bacillus licheniformis α-amylase shown in SEQ ID NO: 4, except that the N-terminal 35 amino acid residues (of the mature protein) has been replaced by the N-terminal 33 residues of EAN (mature protein), i.e., the Bacillus amyloliquefaciens alpha-amylase shown in SEQ ID NO: 5, which further havefollowing mutations: H1554+A181T+N190F+A2094+Q2645 (using the numbering in SEQ ID NO:

 LE174 was constructed by SOE-PCR (Higuchi et al. 1988, Nucleic Acids Research 16:7351).

20

#### Fermentation and purification of α-amylase variants

- A B. subtilis strain harbouring the relevant expression plasmid is streaked on a LB-agar plate with 10 µg/ml kanamycin from -80°C stock, and grown overnight at 37°C.
- 25 The colonies are transferred to 100 ml BPX media supplemented with 10 µg/ml kanamycin in a 500 ml shaking flask. Composition of BPX medium:

	Potato starch	100	g/1
	Barley flour	50	g/1
10	BAN 5000 SKB	0.1	g/1
	Sodium caseinate	10	g/l
	Soy Bean Meal	20	g/1
	NathPOA, 12 HgO	9	g/1
	Pluronic™	0.1	g/1

35

The culture is shaken at 37°C at 270 rpm for 5 days.

Cells and cell debris are removed from the fermentation broth by centrifugation at 4500 rpm in 20-25 minutes. Afterwards the supernatant is filtered to obtain a completely clear solution.

The filtrate is concentrated and washed on a UF-filter (10009 cut off membrane) and the buffer is changed to 20mM Acetate pH 5.5. The UF-filtrate is applied on a S-sepharose F.F. and elution is carried out by step elution with 0.2M NaCl in the same buffer. The eluate is dialysed against 10mM Tris, pH 9.0 and applied on a Q-sepharose F.F. and eluted with a linear gradient from 0-0.3M NaCl over 6 column volumes. The fractions which contain the activity (measured by the Phadebas assay) are pooled, pH was adjusted to pH 7.5 and remaining color was removed by a treatment with 0.5% W/vol. active coal in 5 minutes.

#### Activity determination - (KNU)

15

One Kilo alpah-amylase Unit (1 KNU) is the amount of enzyme which breaks down 5.26 g starch (Merck, Amylum Solubile, Erg. B 6, 20 Batch 9947275) per hour in Novo Nordisk's standard method for determination of alpha-amylase based upon the following condition:

	Substrate	soluble starch
25	Calcium content in solvent	0.0043 M
	Reaction time	7-20 minutes
	Temperature	37°C
	Ha	5.6

30 Detailed description of Novo Nordisk's analytical method (AF 9) is available on request.

# BS-amylase Activity Determination - KNU(S)

# 1. Application Field

This method is used to determine  $\alpha$ -amylase activity in fermentation and recovery samples and formulated and granulated products.

# 2. Principle

BS-amylase breaks down the substrate  $(4,6-\text{ethylidene}(G_1)-p-\text{nitrophenyl}(G_1)-\alpha,D-\text{maltoheptaoside}$  (written as ethylidene- $G_1$ -PNP) into, among other things,  $G_2$ -PNP and  $G_3$ -PNP, where G denoted glucose and PNP p-nitrophenol.

G2-PNP and G3-PNP are broken down by  $\alpha\text{-glucosidase}$ , which is added in excess, into glucose and the yellow-coloured p-nitrophenol.

The colour reaction is monitored in situ and the change in absorbance over time calculated as an expression of the spreed of the reaction and thus of the activity of the enzyme. See the Boehringer Mannheim 1442 309 guidelines for further details.

### 20 2.1 Reaction conditions

Reaction:

Temperature : 37°C pH : 7.1

Pre-incubation time: 2 minutes

25 Detection:

Wavelength : 405 nm
Measurement time 3 minutes

### 3. Definition of Units

30 Bacillus stearothermophius alpha-amylase (BS-amylase) activity is determined relative to a standard of declared activity and stated in Kilo Novo Units (Stearothermophilus) or KNU(S)).

## 4. Specificity and Sensitivity

35 Limit of determination: approx. 0.4 KNU(s)/g

WO 99/19467 PCT/Dk98/08444

36

### 5. Apparatus

Cobas Fara analyser

Diluted (e.g. Hamilton Microlab 1000)

Analytical balance (e.g. Mettler AE 100)

5 Stirrer plates

# 6. Reagents/Substrates

A ready-made kit is used in this analysis to determine  $\alpha$ -amylase activity. Note that the reagents specified for the substrate and  $\alpha$ -glucosidase are not used as described in the Boehringer Mannheim guidelines. However, the designations "buffer", "glass 1", glass 1a" and Glass 2" are those referred to in those guidelines.

# 15 6.1. Substrate

4,6-ethylidene(G $_{7}$ )-p-nitrophenyl(G $_{1}$ )- $\alpha$ ,D-maltoheptaoside (written as ethylidene-G $_{7}$ -PNP) e.g. Boehringer Mannheim 1442 309

# 6.2 α-glucosidase help reagent

20 α-glucosidase, e.g. Boehringer Mannheim 1442 309

## 6.3 BRIJ 35 solution

Demineralized water

882 g up to 2,000 mL

30

# 7. Samples and Standards

## 7.1 Standard curve

35 Ewample: Preparation of BS-amylase standard curve

The relevant standard is diluted to 0.60 KNU(s)/mL as follows. A calculated quantity of standard is weighed out and added to 200 mL volumetric flask, which is filled to around the Z/3 mark with demineralized water. Stabiliser corresponding to 1% of the 5 volume of the flask is added and the flask is filled to the mark with demineralized water.

A Hamilton Microlab 1000 is used to produce the dilutions shown below. Demineralized water with 1% stabiliser is used as the diluent.

10

Dilution No.	Enzyme stock solution	1% stablinser	KNU(s)/mL
1	20µL	580µL	0.02
<u> </u>	30μL	570µI.	0.03
3	40µL	560µL	0.04
9	50µL	550μL	0.05
5	60µL	540µI.	0.06

# 7.2 Level control

A Novo Nordisk A/S BS amylase level control is included in all runs using the Cobas Fara. The control is diluted with 1% is stabiliser so that the final dilution is within the range of the standard curve. All weights and dilutions are noted on the worklist

# 7.3 Sample solutions

# Single determination

Fermentation samples (not final samples) from production, all fermentation samples from pilot plants and storage stability samples are weighed out and analyzed once only.

Double determination over 1 run:

25 Process samples, final fermentation samples from production, samples from GLP studies and R&D samples are weighed out and analyzed twice.

Double determinations over 2 runs:

Finished product samples are weighed out and analyzed twice over two separate runs.

Maximum concentration of samples in powder form: 5%

Test samples are diluted with demineralized water with 1% stabiliser to approx. 0.037 KNU(S)/mL on the basis of their expected activity. The final dilution is made direct into the sample cup.

### 8. Procedure

# 0 8.1 Cobas Menu Program

- The Cobas Menu Program is used to suggest the weight/dilutions of samples and level control to be used.
- The samples are entered into the program with a unique identification code and a worklist is printed out
- The samples and control are weighed out and diluted as stated on the worklist with hand-written weight data is inserted into the BS-amylase analysis logbook
  - The results are computered automatically by the Cobas Fara as described in item 9 and printed out along with the standard
- 20 curve.

30

Worklists and results printouts are inserted into the BSamylase analysis logbook.

# 8.2 Cobas Fara set-up

- 25 The samples are placed in the sample rack
  - The five standards are placed in the calibration rack at position 1 to 5 (strongest standard at position 5), and control placed in the same rack at position 16.
  - The substrate is transferred to a 30 mL reagent container and placed in that reagent rack at position 2 (holder 1).
  - The α-glucosidase help reagent is transferred to a 50 mL reagent container and placed in the reagent rack at position 2 (holder C)

# 35 8.3 Cobas Fare analysis

WO 99/19467 PCT/DK98/00444

The main principles of the analysis are as follows:

20μL sample and 10μL rinse-water are pipetted into the cuvette along with 250μL  $\alpha$ -glucosidase help reagent. The cuvette rotates for 10 seconds and the reagents are thrown out into the horizontal cuvettes. 25μL substrate and 20μL rinse-water are pipetted off. After a 1 second wait to ensure that the temperature is 37°C, the cuvette rotates again and the substrate is mixed into the horizontal cuvettes. Absorbance is measured for the first time after 120 seconds and then every 5 seconds.

#### 9. Calculations

The activity of the samples is calculated relative to Novo Nordisk A/S standard.

15 The standard curve is plotted by the analyzer. The curve is to be gently curved, rising steadily to an absorbance of around 0.25 for standard no. 5.

Absorbance is measured a total of 37 times for each sample.

The activity of the samples in KNU(S)/mL is read off the standard curve by the analyzer.

20 The final calculations to allow for the weights/dilutions used employ the following formula:

Activity in  $KNU(S)/g = S \times V \times F/W$ 

S- analysis result read off (KNU(S)/mL

V= volume of volumetric flask used in mL

25 F= dilution factor for second dilution
W= weight of enzyme sample in g

# 9.2 Calculation of mean values

Results are stated with 3 significant digits. However, for sample activity < 10 KNU(S)/g, only 2 significant digits are given.

The following rules apply on calculation of mean values:

- 1. Data which deviates more than 2 standard deviations from the mean value is not included in the calculation.
- 35 2. Single and double determination over one run: The mean value is calculated on basis of results lying within the standard curve's activity area.

3. Double determinations over two runs: All values are included in the mean value. Outliers are omitted.

## 10. Accuracy and Precision

5 The coefficient of variation is 2.9% based on retrospective validation of analysis results for a number of finished products and the level control.

# Assay for Q-Amylase Activity

10 α-Amylase activity is determined by a method employing Phadebas® tablets as substrate. Phadebas tablets (Phadebas® Amylase Test, supplied by Pharmacia Diagnostic) contain a crosslinked insoluble blue-coloured starch polymer which has been mixed with bovine serum albumin and a buffer substance and tabletted.

For every single measurement one tablet is suspended in a tube containing 5 ml 50 mM Britton-Robinson buffer (50 mM acetic acid, 50 mM phosphoric acid, 50 mM boric acid, 0.1 mM CaCl, pH adjusted to the value of interest with NaOH). The test is performed in a water bath at the temperature of interest. The  $\alpha$ -amylase to be tested is diluted in x ml of 50 mM Britton-Robinson buffer. 1 ml of this  $\alpha$ -amylase solution is added to the 5 ml 50 mM Britton-Robinson buffer. The starch is hydrolysed by the  $\alpha$ -amylase giving soluble blue fragments. The absorbance of the resulting blue solution, measured spectrophotometrically at 620 nm, is a function of the  $\alpha$ -amylase activity.

It is important that the measured 620 nm absorbance after 10 or 15 minutes of incubation (testing time) is in the range of 0.2 to 2.0 absorbance units at 620 nm. In this absorbance range 30 there is linearity between activity and absorbance (Lambert-Beer law). The dilution of the enzyme must therefore be adjusted to fit this criterion. Under a specified set of conditions (temp., pH, reaction time, buffer conditions) 1 mg of a given u-amylase will hydrolyse a certain amount of substrate and a blue colour will be produced. The colour intensity is measured at 620 nm. The measured absorbance is directly proportional to the specific

activity (activity/mg of pure  $\alpha\text{-amylase}$  protein) of the  $\alpha\text{-amylase}$  in question under the given set of conditions.

PCT/DK98/00444 42

#### EXAMPLES

### EXAMPLE 1

10

25

30

# Construction of variants of BSG g-amylase (SEQ ID NO: 3)

The gene encoding BSG, amyS, is located in plasmid pFL1117. This plasmid contains also the gene conferring resistance towards kanamycin and an origin of replication, both obtained from plasmid pUB110 (Gryczan, T.J. et al (1978) J.Bact 134:318-329).

The DNA sequence of the mature part of amyS is shown as SEQ ID NO: 11 and the amino acid sequence of the mature protein is shown as SEO ID NO: 3

BSG variant TVB145, which contains a deletion of 6 nucleotides corresponding to amino acids I181-G182 in the 15 mature protein, is constructed as follows:

Polymerase Chain Reaction (PCR) is utilized to amplify the part of the amyS gene (from plasmid pPL1117), located between DNA primers BSG1 (SEQ ID NO: 15) and BSGM2 (SEQ ID NO: 18). BSG1 is identical to a part of the amyS gene whereas BSGM2 20 contains the 6 bp nucleotide deletion. A standard PCR reaction is carried out: 94°C for 5 minutes, 25 cycles of (94°C for 45 seconds, 50°C for 45 seconds, 72°C for 90 seconds), 72°C for 7 minutes using the Pwo polymerase under conditions as recommended by the manufacturer, Boehringer Mannheim Gmbh.

The resulting approximately 550 bp amplified band was used as a megaprimer (Barik, S and Galinski, MS (1991): Biotechniques 10: 489-490) together with primer BSG3 in a second PCR with pPL1117 as template resulting in a DNA fragment of approximately 1080 bp.

This DNA fragment is digested with restriction endonucleases Acc65I and SalI and the resulting approximately 550 bp fragment is ligated into plasmid pPL1117 digested with the same enzymes and transformed into the protease- and amylase-deleted Bacillus subtilis strain SHA273 (described in W092/11357 and W095/10603).

Kanamycin resistant and starch degrading transformants were analysed for the presence of the desired mutations (restriction WO 99/19467 PCT/DR/98/00444 43

digest to verify the introduction of a HindIII site in the gene). The DNA sequence between restriction sites Acc65I and Sall was verified by DNA sequencing to ensure the presence of only the desired mutations.

- BSG variant TVB146 which contains the same 6 nucleotide deletion as TVB145 and an additional substitution of asparagine 193 for a phenylalanine, N193F, was constructed in a similar way as TVB145 utilizing primer BSGM3 (SEQ ID NO: 19) in the first PCR.
- 16 BSG variant TVB161, containing the deletion of 1181-G182, N193F, and L204F, is constructed in a similar way as the two previous variants except that the template for the PCR reactions is plasmid pTVB146 (pPL1117 containing the TVB146mutations within amyS and the mutagenic oligonucleotide for the first PCR is BSGM3.

BSG variant TVB162, containing the deletion of Il81-G182, N193F, and E210H, is constructed in a similar way as TVB161 except that the mutagenic oligonucleotide is BSGM4 (SEQ ID NO: 201.

BSG variant TVB163, containing the deletion of I181-G182. 20 N193F, and E214Q, is constructed in a similar way as TVB161 except that the mutagenic oligonucleotide is BSGM5 (SEQ ID NO: 21).

The above constructed BSG variants were then fermented and purified as described above in the "Material and Methods" 25 section.

### EXAMPLE 2

# Measurement of the calcium- and pH-dependent stability

- Normally, the industrial liquefaction process runs using pH 6.0-6.2 as liquefaction pH and an addition of 40 ppm free calcium in order to improve the stability at 95°C-105°C. Some of the herein proposed substitutions have been made in order to improve the stability at
- 1. lower pH than pH 6.2 and/or
  - 2. at free calcium levels lower than 40 ppm free calcium. Two different methods have been used to measure the improvements in stability obtained by the different

substitutions in the a-amylase from B.stearothermophilus:

Method 1. One assay which measures the stability at reduced pH, pH 5.0, in the presence of 5 ppm free calcium.

10 µg of the variant were incubated under the

5 following conditions: A 0.1 M acetate solution, pH adjusted to pH 5.0, containing 5ppm calcium and 5% w/w common corn starch (free of calcium). Incubation was made in a water bath at 95°C for 30 minutes.

Method 2. One assay which measure the stability in the absence of free calcium and where the pH is maintained at pH 6.0. This assay measures the decrease in calcium sensitivity: 10 µg of the variant were incubated under the following conditions: A 0.1 M acetate solution, pH adjusted to pH 6.0, containing 5% w/w common corn starch (free of calcium). Incubation was made in a water bath at 95°C for 30 minutes.

## Stability determination

All the stability trials 1, 2 have been made using 20 the same set up. The method was:

The enzyme was incubated under the relevant conditions (1-4). Samples were taken at 0, 5, 10, 15 and 30 minutes and diluted 25 times (same dilution for all taken samples) in assay buffer (0.1M 50mM Britton buffer pH 7.3) and the activity was

25 measured using the Phadebas assay (Pharmacia) under standard conditions pH 7.3, 37°C.

The activity measured before incubation (0 minutes) was used as reference (100%). The decline in percent was calculated as a function of the incubation time. The table shows the 30 residual activity after 30 minutes of incubation.

# variant TVB146

Filot plant liquefaction experiments were run in the minijet system using a dosage of 50 NU (S)/g DS at pH 5.5 with 5 ppm added Ca", to compare the performance of formulated BSG alpha-amylase variant TVB146 (SEQ ID NO: 3 with deletion in positions

I181-G182 + N193F) with that of parent BSG alpha-amylase (SEQ TO NO: 3). The reaction was monitored by measuring the DE increase (Neocuproine method) as a function of time.

Corn starch slurries were prepared by suspending 11.8 kg 10 Cerestar C\*Pharm GL 03406 (89 % starch) in deionized water and making up to 30 kg. The pR was adjusted to 5.5 at ambient temperature, after the addition of 0.55 c CaCl, 2H,O.

The following enzymes were used:

15

108 KNU(S)/g. 146 KNU(SM9)/g TVB146 BSG amylase 101 KNU(S)/g, 98 KNU(SM9)/g

An amount of enzyme corresponding to 50 NU (SM9)/g DS was 20 added, and the conductivity adjusted to 300mS using NaCl. The standard conditions were as follows:

Substrate concentration 35 % w/w (initial)

31.6-31.9 % w/w (final)

105°C, 5 min (Primary liquefaction) 25 Temperature

95°C, 90 min (Secondary liquefaction)

pH (initial) 5.5

After jetting, the liquefied starch was collected and transported in sealed thermos-flasks from the pilot plant to the laboratory, where secondary liquefaction was continued at 95 °C.

10 ml samples were taken at 15 minute intervals from 15-90 minutes. 2 drops of 1 N RCl were added to inactivate the enzyme. From these samples, 0.3-0.1 a (according to the expected DE) were weighed out and diluted to 100 ml. Reducing sugars were then determined according to the Neocuproine method (Determination of reducing sugar with improved precision.

Dygert, Li, Florida and Thomas (1965). Anal. Biochem 13, 368) and DE values determined. The development of DE as a function of time is given in the following table:

	TVBI46	850
Time (min.)	DE (neocu	proine)
15	2.80	2.32
30	4.88	3.56
45	6.58	4.98
60	8.17	6.00
75	9.91	7.40
90	11.23	8.03
1		1

5

As can be seen the alpha-amylase variant TVB146 performed significantly better under industrially relevant application conditions at low levels of calcium than the parent BSG alpha-amylase.

10

## EXAMPLE 4

Jet Cook and Liquefaction with a combination of alpha-amylase variants (TVB146 and LE174)

Jet cook and liquefaction using a combination of the alphaamylase variants, TVB146 and LE174 (ratio 1:1) were carried out at the following conditions:

Substrate A.E. Staley food grade powdered corn starch (100lbs)

D.S. 35% using DI water

W Free  $Ca^{2*}$  2.7ppm at pH 5.3 (none added, from the starch only) Initial pH 5.3

Dose AF9 units (AF9 is available on request) for each enzyme variant was 28 NU/g starch db for a total dose of 56 NU/g

Temperature in primary liquefaction 105°C 25 Hold time in primary liquefaction 5 minutes

Temperature in secondary liquefaction 95°C

At 15 minutes into secondary liquefaction 1.5 gms of hydrolyzate was added to a tared one liter volumetric containing 500cc of DI water and 1 ml of one normal HCl and the exact wt. added was recorded. This was repeated at 15 minute intervals out to 90 minutes with an additional point at 127

WO 99/19467

49

PCT/DK98/08444

minutes. These were diluted to one liter and determined for dextrose equivalence via Neocuproine method as discribed by Dygert,Li, Florida and Thomas. Determination of reducing sugar with improved precision (1965). Anal. Biochem 13, 368.

The results were as follo	The	collows
---------------------------	-----	---------

Time	DE
15	3.2
30	4.8
45	6.3
60	7.8
75	9.4
90	10.4
127	72.7

#### CLAIMS

1. A variant of a parent Termamyl-like  $\alpha$ -amylase with  $\alpha$ -amylase activity comprising mutations in two, three, four, five or six

of the following regions/positions or in corresponding positions

in other parent Termamyl-like  $\alpha\text{--amylases:}$ 

(relative to SEQ ID NO: 1):

- 1: R181\*, G182\*, T183\*, G184\*
- 2: N195A, R, D, C, E, Q, G, H, I, L, K, M, F, P, S, T, W, Y, V;
- 10 3: V206A, R, D, N, C, E, Q, G, H, I, L, K, M, F, P, S, T, W, Y;
  - 4: E212A.R.D.N.C.O.G.H.I.L.K.M.F.P.S.T.W.Y.V:
    - 5: E216A, R, D, N, C, Q, G, H, I, L, K, M, F, P, S, T, W, Y, V;
  - 6: K269A,R,D,N,C,E,Q,G,H,I,L,M,F,P,S,T,W,Y,V; (relative to SEO ID NO: 2):
- 15 1: R181\*.G182\*.D183\*.G184\*
  - 2: N195A, R, D, C, E, Q, G, H, I, L, K, M, F, P, S, T, W, Y, V;
  - 3: V206A, R. D. N. C. E. O. G. H. I. L. K. M. F. P. S. T. W. Y;
  - 4: E212A, R. D. N. C. O. G. H. I. L. K. M. F. P. S. T. W. Y. V;
  - 5: E216A, R, D, N, C, Q, G, H, I, L, K, M, F, P, S, T, W, Y, V;
- 20 6: K269A,R,D,N,C,E,Q,G,H,I,L,M,F,P,S,T,W,Y,V; (Relative to SEO ID NO: 3):
  - 1: R179\*,G180,I181\*,G182\*
  - 2: N193A, R, D, C, E, Q, G, H, I, L, K, M, F, P, S, T, W, Y, V;

- 10 6: K269A, R, D, N, C, E, Q, G, H, I, L, M, F, P, S, T, W, Y, V;
  - 2. The variant according to claim 1. comprising the following mutations: N190F/Q2645 in SEQ ID NO: 4 or in corresponding positions in another parent  $\alpha$ -amylase.
  - 3. The variant according to claim 1, comprising the following mutations: I181\*/G182\*/N193F in SEQ ID NO: 3 or in corresponding positions in another parent Termamyl like q-amylase.
- 20 4. The variant according to claim 3, further comprising a substitution in position E214Q in SEQ ID NO: 3 or in a corresponding position in another parent Termanyl like aamylase.
- 25 5. The variant according to any of claims 1 to 4, wherein the parent  $\alpha$ -amylase is a hybrid  $\alpha$ -amylase of SEO ID NO: 4 and SEO ID NO: 5.
- 6. The variant according to claim 5, wherein the parent hybrid 30 α-amylase is a hybrid alpha-amylase comprising the 445 Cterminal amino acid residues of the B. licheniformis a-amylase shown in SEO ID NO: 4 and the 37 N-terminal amino acid residues of the a-amylase derived from B. amyloliquefaciens shown in SEO TD NO: 5.

35

19

7. The variant according to claim 6, wherein the parent hybrid

WO 99/19467 PCT/DK98/08444

54

Termamyl-like u-amylase further has the following mutations: H156Y+A181T+N190F+A209V+Q264S (using the numbering in SEQ ID NO: 4)

- 5 8. The variant according to claim 1, exhibiting increased stability at acidic pH and/or low  $Ca^{2\alpha}$  concentration:
  - 9. A DNA construct comprising a DNA sequence encoding an  $\alpha\textsubscript{-}$  amylase variant according to any one of claims 1 to 8.
  - 10. A recombinant expression vector which carries a DNA construct according to claim 9.

m

- 11. A cell which is transformed with a DNA construct according to claim 9 or a vector according to claim 10.
  - 12. A cell according to claim 11, which is a microorganism.
- 13. A cell according to claim 12, which is a bacterium or a 20 fungus.
  - 14. The cell according to claim 13, which is a grampositive bacterium such as Bacillus subtilis, Bacillus licheniformis, Bacillus lentus, Bacillus brevis, Bacillus stearothermophilus, Bacillus alkalenhilus, Bacillus and Bacillus alkalenhilus.
- 25 Bacillus alkalophilus, Bacillus amyloliquefaciens, Bacillus coagulans, Bacillus circulans, Bacillus lautus or Bacillus thuringiensis.
- 15. A detergent additive comprising an α-amylase variant according to any one of claims 1 to 8, optionally in the form of a non-dusting granulate, stabilised liquid or protected enzyme.
  - 16. A detergent additive according to claim 15 which contains 0.02-200 mg of enzyme protein/g of the additive.
  - 17. A detergent additive according to claims 15 or 16, which additionally comprises another enzyme such as a protease, a

PCT/DK98/00444 WO 99/19467 22

lipase, a peroxidase, another amylolytic enzyme and/or a cellulase.

- 18. A detergent composition comprising an u-amylase variant according to any of claims 1 to 8.
  - 19. The detergent composition according to claim 18 which additionally comprises another enzyme such as a protease, a lipase, a peroxidase, another amylolytic enzyme and/or a cellulase.
  - 20. A manual or automatic dishwashing detergent composition comprising an a-amylase variant according to any one of claims 1 to 8.
- 21. A dishwashing detergent composition according to claim 20 which additionally comprises another enzyme such as a protease, a lipase, a peroxidase, another amylolytic enzyme and/or a cellulase.
- 22. A manual or automatic laundry washing composition comprising an  $\alpha$ -amylase variant according to any one of claims 1 to 8.
  - 23. A laundry washing composition according to claim 22, which additionally comprises another enzyme such as a protease, a lipase, a peroxidase, an amylolytic enzyme and/or a cellulase.

### 24. A composition comprising:

- (i) a mixture of the α-amylase from B. licheniformis having the sequence shown in SEQ ID NO: 4 with one or more variants according to any of claims 1 to 8 derived from (as the parent Termamyl-like α-amylase) the B. stearothermophilus α-amylase having the sequence shown in SEO ID NO: 3; or
- (ii) a mixture of the α-amylase from B. stearothermophilus having the sequence shown in SEQ ID NO: 3 with one or more variants according to any of claims 1 to 8 derived from one or more other parent Termamvl-like q-amvlases; or

(iii) a mixture of one or more variants according any of claim 1 to 8 derived from (as the parent Termamyl-like  $\alpha$ -amylase) the B. stearothermophilus  $\alpha$ -amylase having the sequence shown in SEQ ID NO: 3 with one or more variants according to the invention derived from one or more other parent Termamyl-like  $\alpha$ -amylases.

# 25. A composition comprising:

a mixture of one or more variants according any of claims 1 to 8 derived from (as the parent Termamyl-like  $\alpha$ -amylase) the B. stearothermophilus  $\alpha$ -amylase having the sequence shown in SEQ ID NO: 3 and a Termamyl-like alpha-amylase derived from the B. licheniformis  $\alpha$ -amylase having the sequence shown in SEQ ID NO: 4.

# 15 26. The composition comprising:

a mixture of one or more variants according any of claims 1 to 8 derived from (as the parent Termamyl-like α-amylase) the B. stearothermophilus α-amylase having the sequence shown in SEQ ID NO: 3 and a hybrid alpha-amylase comprising a part of the B. amyloliquefaciens α-amylase shown in SEQ ID NO: 5 and a part of the B. licheniformis α-amylase shown in SEQ ID NO: 4.

- The composition according to claim 26, wherein the hybrid α-amylase is a hybrid alpha-amylase comprising the 445 C-terminal
   amino acid residues of the B. licheniformis α-amylase shown in
   SEQ ID NO: 4 and the 37 N-terminal amino acid residues of the α-amylase derived from B. amyloliquefaciens shown in SEQ ID NO: 5.
  - 28. The composition according to claim 27, wherein the hybrid  $\alpha$ -amylase further has the following mutations: H156Y+A181T+N190F+A209V+Q264S (using the numbering in SEQ ID NO: 4).
    - 29. The composition according to claims 26, comprising a mixture

WO 99/19467

PCT/DK98/00444

of TVB146 and LE174.

30. Use of an  $\alpha$ -amylase variant according to any of claims 1 to 8 or a composition according to any of claims 24 to 29 for washing and/or dishwashing.

57

31. Use of an  $\alpha\text{-amylase}$  variant according to any of claims 1 to 8 or a composition according to any of claims 24 to 29 for textile desizing.

- 32. Use of an  $\alpha$ -amylase variant according to any of claims 1 to 8 or a composition according to any of claims 24 to 29 for starch liquefaction.
- 15 33. A method for generating a variant of a parent Termamyl-like  $\alpha$ -amylase, which variant exhibits increased stability at low pH and at low calcium concentration relative to the parent, the method comprising:
- (a) subjecting a DNA sequence encoding the parent Termamyl-like  $$\alpha $-$$  amylase to random mutagenesis,
  - (b) expressing the mutated DNA sequence obtained in step (a) in a host cell, and
- (c) screening for host cells expressing a mutated  $\alpha$ -amylase which has increased stability at low pH and low calcium 25 concentration relative to the parent  $\alpha$ -amylase.

#### A. CLASSIFICATION OF SUBJECT MATTER

IPC6: C12N 9/28, C11D 3/386 According to International Patent Classification (IPC) or to both national classification and IPC

### B. FIELDS SEARCHED

Minimum documentation scarched (classification system followed by classification symbols)

#### IPC6: C12N, C11D

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

### SE.DK.FI.NO classes as above

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

## WPI, PAJ, BIOSIS, CA

### C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category.	Citation of document, win indication, where appropriate, of the relevant passages	Kelevant to ctaim No.

X Further documents are listed in the continuation of Box C.

y See patent family annex.

Special esteeperes of estad documents: "A" discurrent defizing the general state of the act which is not considered

meani reason (as meaned)

- to be of perticular relevance
- "E" erlier document but published on or after the international filing date document which may throw doubts on priority classics) or which is cried to establish the publication date of another citation or other
- "O" document reforming to an oral discioners, use, exhibition or other mesne
- document published once to the international filing date but later than the priority date claimed
- "I" taker document published after the international filing date or propriy date and not in conflict with the application but cruck to understand the principle or theory underlying the invention "X" document of perfocular relevance: the elamon invention cannot be considered nows or cannot be considered to involve an inventive step wisen the document is taken alone
- "Y" document of particular relevance: the claimed invention cannot be
- considered to myolve an inventive step when the document is combined with one or more other such documents, such combination being obtions to a person skilled in the art.
- "&" document member of the same patent family

PCT/DK 98/00444

Box I	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)						
This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:							
1.	Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:						
2. 🏻	Claims Nor.: because they relate to parts of the international application that do not comply with the prescribed requirement to such an extent that no meaningful international search can be carried out, specifically:						
3.	Claims Non.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).						
Box II	Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)						
thes Sev enz the that Alth sear	e claimed inventions relates to variants of a parent Termamyl-like alpha-amylase arge number of combinations of mutations are suggested, which give increased translating and the properties of						
1.	As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.						
2. X	As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.						
3. 🔲	As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those chains for which fees were paid, specifically claims Nos.:						
*· 🔲 ;	No required additional search fees were timely paid by the applicant. Consequently, this international search recommend to the invention first mentioned in the claims; it is covered by claims Nos.:						
Remark o	n Protest The additional search fees were accompanied by the applicant's protest.  No protest accompanied the payment of additional search fees.
